

General intro on the state of the art of AI in the innovation process

Abstract:

This talk is intended to be a (possibly) inspirational introduction to the symposium topic, which is AI4I – Artificial Intelligence for Innovation: how AI may impact the Innovation Process, rather than a technical overview of the several AI tools that may support the Innovation Process. Certainly, AI should impact the way I teach at academic courses how to manage Technological Innovation, how I coach young entrepreneurs aiming at founding their own startups, how I give advice to companies on the Innovation matter ... But what should we keep doing taking into account the AI may do it better? Is there any space left for humans? This talk is just reflecting about these questions, leaving some of the possible answers to the other lecturers.
