

Presentation of Errequadro, a deep-tech firm delivering AI-based cognitive engines and ML tools for automated classification, analysis, and strategic exploitation of technical and patent documentation.

Riccardo Apreda – *cofounder of Erre Quadro*

In today's highly competitive and knowledge-driven economy, technical documents—especially patents—represent a strategic resource that is still largely underexploited. While recent advancements in AI and LLMs have raised expectations across many sectors, their application in technical domains is still hindered by issues such as high implementation costs, persistent hallucinations and lack of control on the accuracy of the results. The talk will discuss the potential limitations of generic AI models and propose the combination of Artificial and Human intelligence as a possible strategy to enable reliable, scalable, and context-aware interpretation of complex technical content.
